# Lefschetz-type properties of cohomology rings

Ananyo Dan

CUNEF UNIVERSIDAD, MADRID

June 27, 2024

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

 Cohomology rings of projective varieties have a natural graded Artinian ring structure.

 Cohomology rings of projective varieties have a natural graded Artinian ring structure.

Unfortunately, in most cases the ring is non-commutative.

- Cohomology rings of projective varieties have a natural graded Artinian ring structure.
- Unfortunately, in most cases the ring is non-commutative.
- Objective: Study Lefschetz-type properties of these rings and certain commutative subrings.

X a non-singular quasi-projective variety

► Cohomology of X:  $H^k(X, \mathbb{Z}) = \frac{\text{closed } k \text{-forms on } X}{\text{exact } k \text{-forms on } X}$ 

**Example:** Take 
$$X = \mathbb{C}^n$$
.

By Poincaré lemma (closed forms on contractible spaces are exact), observe that for k > 0, every closed differential k-form is exact.

$$\blacktriangleright H^k(\mathbb{C}^n,\mathbb{Z}) = \begin{cases} \mathbb{Z} & \text{if } k = 0 \\ 0 & \text{otherwise} \end{cases}$$

#### • Consider a hyperplane $Y = \{z_n = 0\}$ . Observe $\mathbb{P}^n \setminus Y \cong \mathbb{C}^n$ .

• Consider a hyperplane  $Y = \{z_n = 0\}$ . Observe  $\mathbb{P}^n \setminus Y \cong \mathbb{C}^n$ .

We have an exact sequence:

 $\dots \to H^i(\mathbb{P}^n, \mathbb{C}^n) \to H^i(\mathbb{P}^n) \to H^i(\mathbb{C}^n) \to H^{i+1}(\mathbb{P}^n, \mathbb{C}^n) \to \dots$ 

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

• Consider a hyperplane  $Y = \{z_n = 0\}$ . Observe  $\mathbb{P}^n \setminus Y \cong \mathbb{C}^n$ .

We have an exact sequence:

 $... \to H^{i}(\mathbb{P}^{n}, \mathbb{C}^{n}) \to H^{i}(\mathbb{P}^{n}) \to H^{i}(\mathbb{C}^{n}) \to H^{i+1}(\mathbb{P}^{n}, \mathbb{C}^{n}) \to ...$ 

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

▶ Thom isomorphism:  $H^{i}(\mathbb{P}^{n},\mathbb{C}^{n})\cong H_{2n-i}(Y)\xrightarrow{PD}_{\sim} H^{i-2}(Y).$ 

• Consider a hyperplane  $Y = \{z_n = 0\}$ . Observe  $\mathbb{P}^n \setminus Y \cong \mathbb{C}^n$ .

We have an exact sequence:

$$\dots \to H^{i}(\mathbb{P}^{n},\mathbb{C}^{n}) \to H^{i}(\mathbb{P}^{n}) \to H^{i}(\mathbb{C}^{n}) \to H^{i+1}(\mathbb{P}^{n},\mathbb{C}^{n}) \to \dots$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

▶ Recall, if dim<sub>ℂ</sub>(X) = n, then dim  $H^i(X, \mathbb{Z}) = 0$  for all i > 2nand dim  $H^i(X, \mathbb{Q})$  is finite dimensional for all  $i \ge 0$ .

Recall, wedge product of differential forms

 $(p-form) \land (q-form) \mapsto (p+q-form).$ 

- Wedge product of closed forms is closed.
- The wedge product on the differential forms induce a cup-product map:

$$\cup: H^p(X,\mathbb{Z})\otimes H^q(X,\mathbb{Z}) \to H^{p+q}(X,\mathbb{Z})$$

- ▶ Recall, if dim<sub>ℂ</sub>(X) = n, then dim  $H^i(X, \mathbb{Z}) = 0$  for all i > 2nand dim  $H^i(X, \mathbb{Q})$  is finite dimensional for all  $i \ge 0$ .
- Therefore, the cohomology ring

$$H^*(X,\mathbb{Q}) = \bigoplus_{i\geq 0} H^i(X,\mathbb{Q})$$

has a natural graded Artinian ring structure with multiplication operator given by cup-product.

# Examples of ring structure $ightarrow H^*(\mathbb{C}^n, \mathbb{Q}) = \mathbb{Q}$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

 $\blacktriangleright H^*(\mathbb{C}^n,\mathbb{Q}) = \mathbb{Q}$ 

The natural map:

 $\mathbb{Q}[t]/(t^{n+1}) o H^*(\mathbb{P}^n,\mathbb{Q})$  with  $t \mapsto [Y]$ 

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

is an isomorphism, where  $Y \subset \mathbb{P}^n$  is a hyperplane.

 $\blacktriangleright H^*(\mathbb{C}^n,\mathbb{Q})=\mathbb{Q}$ 

The natural map:

 $\mathbb{Q}[t]/(t^{n+1}) o H^*(\mathbb{P}^n,\mathbb{Q})$  with  $t\mapsto [Y]$ 

is an isomorphism, where  $Y \subset \mathbb{P}^n$  is a hyperplane.

Let X be a smooth, projective curve of genus g. Then,

$$H^{i}(X,\mathbb{Z}) = egin{cases} \mathbb{Z} & ext{if } i = 0 \ \mathbb{Z}^{\oplus 2g} & ext{if } i = 1 \ \mathbb{Z} & ext{if } i = 2 \end{cases}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

 $\blacktriangleright H^*(\mathbb{C}^n,\mathbb{Q})=\mathbb{Q}$ 

The natural map:

 $\mathbb{Q}[t]/(t^{n+1}) o H^*(\mathbb{P}^n,\mathbb{Q})$  with  $t\mapsto [Y]$ 

is an isomorphism, where  $Y \subset \mathbb{P}^n$  is a hyperplane.

▶ Let X be a smooth, projective curve of genus g. Then,

$$H^{i}(X,\mathbb{Z}) = \begin{cases} \mathbb{Z} & \text{if } i = 0\\ \mathbb{Z}^{\oplus 2g} & \text{if } i = 1\\ \mathbb{Z} & \text{if } i = 2 \end{cases}$$

► H<sup>1</sup>(X, Q) is a symplectic vector space under cup-product (i.e., vector space equipped with a non-degenerate alternating bilinear form).

• **Example:** Let *C* be a smooth, projective curve of genus at least 1.

- Let X be a (smooth) projective variety.
- We say that X satisfies the weak Lefschetz property if for a general ζ ∈ H<sup>1</sup>(X, Q), the cup-product map

 $\cup \zeta : H^{i}(X, \mathbb{Q}) \to H^{i+1}(X, \mathbb{Q})$  is of maximal rank  $\forall i$ .

- Similarly, X is said to satisfy the strong Lefschetz property if (∪ζ)<sup>d</sup> : H<sup>i</sup>(X, Q) → H<sup>i+d</sup>(X, Q) is of maximal rank for all i, d.
- Example: Let C be a smooth, projective curve of genus at least 1.
  - For a general  $\zeta \in H^1(\mathcal{C}, \mathbb{Q})$ , the cup-product map:

$$\cup \zeta: H^1(\mathcal{C}, \mathbb{Q}) \to H^2(\mathcal{C}, \mathbb{Q}) \cong \mathbb{Q}$$

is surjective, hence of maximal rank.

- Let X be a (smooth) projective variety.
- We say that X satisfies the weak Lefschetz property if for a general ζ ∈ H<sup>1</sup>(X, Q), the cup-product map

 $\cup \zeta : H^i(X, \mathbb{Q}) \to H^{i+1}(X, \mathbb{Q})$  is of maximal rank  $\forall i$ .

- Similarly, X is said to satisfy the strong Lefschetz property if (∪ζ)<sup>d</sup> : H<sup>i</sup>(X, Q) → H<sup>i+d</sup>(X, Q) is of maximal rank for all i, d.
- **Example:** Let *C* be a smooth, projective curve of genus at least 1.
  - For a general  $\zeta \in H^1(\mathcal{C},\mathbb{Q})$ , the cup-product map:

$$\cup \zeta : H^1(\mathcal{C}, \mathbb{Q}) o H^2(\mathcal{C}, \mathbb{Q}) \cong \mathbb{Q}$$

is surjective, hence of maximal rank.

• Therefore, C satisfies the strong Lefschetz property. In particular, C satisfies the weak Lefschetz property.

## Counterexample to NC-WLP

Theorem (-): Product of smooth, projective curves do not always satisfy the weak Lefschetz property. In particular, take a smooth rational curve X and a smooth curve Y of genus at least 1. Then, X × Y does not satisfy the WLP.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Counterexample to NC-WLP

- Theorem (-): Product of smooth, projective curves do not always satisfy the weak Lefschetz property. In particular, take a smooth rational curve X and a smooth curve Y of genus at least 1. Then, X × Y does not satisfy the WLP.
- Idea of the proof: Denote by

 $p: X \times Y \to X$  and  $q: X \times Y \to Y$ 

the natural projection maps.

### Counterexample to NC-WLP

- Theorem (-): Product of smooth, projective curves do not always satisfy the weak Lefschetz property. In particular, take a smooth rational curve X and a smooth curve Y of genus at least 1. Then, X × Y does not satisfy the WLP.
- Idea of the proof: Denote by

$$p: X \times Y \to X$$
 and  $q: X \times Y \to Y$ 

the natural projection maps.

By the Künneth decomposition, we have:

$$egin{aligned} & H^1(X imes Y,\mathbb{Q})\cong q^*H^1(Y,\mathbb{Q}), \ \ ext{and} \ & H^2(X imes Y,\mathbb{Q})\cong p^*H^2(X,\mathbb{Q})\oplus q^*H^2(Y,\mathbb{Q})\cong \mathbb{Q}^{\oplus 2} \end{aligned}$$

► Take  $\zeta \in H^1(X \times Y, \mathbb{Q})$ .

• Take  $\zeta \in H^1(X \times Y, \mathbb{Q})$ .

• There exists  $\zeta' \in H^1(Y, \mathbb{Q})$  such that  $q^*\zeta' = \zeta$ 

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

• Take  $\zeta \in H^1(X \times Y, \mathbb{Q})$ .

▶ There exists  $\zeta' \in H^1(Y, \mathbb{Q})$  such that  $q^* \zeta' = \zeta$ 

▶ Since *q*<sup>\*</sup> commutes with cup-product, we have:

$$H^{1}(Y,\mathbb{Q}) \xrightarrow{0 \oplus (\cup\zeta')} H^{2}(X,\mathbb{Q}) \oplus H^{2}(Y,\mathbb{Q})$$

$$q^{*} \bigg| \cong \qquad \circlearrowleft \qquad = \bigg| p^{*} \oplus q^{*}$$

$$H^{1}(X \times Y,\mathbb{Q}) \xrightarrow{\cup\zeta} H^{2}(X \times Y,\mathbb{Q})$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

• Take  $\zeta \in H^1(X \times Y, \mathbb{Q})$ .

▶ There exists  $\zeta' \in H^1(Y, \mathbb{Q})$  such that  $q^*\zeta' = \zeta$ 

Since q\* commutes with cup-product, we have:

Therefore, ∪ζ is neither injective, nor surjective. So, X × Y does not satisfy WLP.

Question: How does the property WLP vary in (smooth) families of projective varieties?

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

- Question: How does the property WLP vary in (smooth) families of projective varieties?

→ H<sup>\*</sup><sub>Hdg</sub>(X) is a graded Artinian Q-algebra.
 → Example: H<sup>\*</sup><sub>Hdg</sub>(P<sup>n</sup>) = Q[t]/(t<sup>n+1</sup>).

Weak/Strong Hodge-Lefschetz property

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Let X be a projective variety.

Weak/Strong Hodge-Lefschetz property

Let X be a projective variety.

We say that X satisfies weak Hodge-Lefschetz property (resp. strong Hodge-Lefschetz property) if H<sup>\*</sup><sub>Hdg</sub>(X) satisfies WLP (resp. SLP).

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●
Weak/Strong Hodge-Lefschetz property

- Let X be a projective variety.
- We say that X satisfies weak Hodge-Lefschetz property (resp. strong Hodge-Lefschetz property) if H<sup>\*</sup><sub>Hdg</sub>(X) satisfies WLP (resp. SLP).
- Using Hard Lefschetz theorem it is easy to check that every smooth, projective variety satisfies weak and strong Hodge-Lefschetz property.

Weak/Strong Hodge-Lefschetz property

- $\blacktriangleright \dots \to H^{2i}_{x_0}(\mathbb{P}^4) \to H^{2i}(\mathbb{P}^4) \to H^{2i}(\mathbb{P}^4 \setminus x_0) \to H^{2i+1}_{x_0}(\mathbb{P}^4) \to \dots$ Thom isomorphism  $\Rightarrow \mathbb{Z} \cong H^{2i}(\mathbb{P}^4) \cong H^{2i}(\mathbb{P}^4 \setminus x_0)$  for i = 1, 2

▶ Consider the hypersurface  $X \subset \mathbb{P}^4$  defined by the equation

$$X_0^2 + X_1^2 + X_2^2 + X_3^2.$$

- Note that, X is a projective cone over a non-singular quadric surface Q in P<sup>3</sup>.
- X is singular at  $x_0 := [0:0:0:1]$ . Denote by  $U := X \setminus x_0$ .
- There is a natural projection:  $U \rightarrow Q$  which makes U into an  $\mathbb{A}^1$ -bundle over Q.
- ▶ This means, *U* is homotopic to *Q*. ⇒  $H^2(U, \mathbb{Z}) \cong H^2(Q, \mathbb{Z}) \cong \mathbb{Z} \oplus \mathbb{Z}$  and  $H^4(U, \mathbb{Z}) \cong H^4(Q, \mathbb{Z}) \cong \mathbb{Z}$
- ...  $\rightarrow H^{2i}_{x_0}(\mathbb{P}^4) \rightarrow H^{2i}(\mathbb{P}^4) \rightarrow H^{2i}(\mathbb{P}^4 \setminus x_0) \rightarrow H^{2i+1}_{x_0}(\mathbb{P}^4) \rightarrow ...$ Thom isomorphism  $\Rightarrow \mathbb{Z} \cong H^{2i}(\mathbb{P}^4) \cong H^{2i}(\mathbb{P}^4 \setminus x_0)$  for i = 1, 2
- ► Hence, Lefschetz hyperplane theorem and Hard Lefschetz fail for  $U \hookrightarrow \mathbb{P}^4 \setminus x_0$ .

# What about WLP and SLP?

► We computed: 
$$H^{i}(U, \mathbb{Q}) = \begin{cases} \mathbb{Q} & \text{if } i = 0, 4 \\ \mathbb{Q}^{\oplus 2} & \text{if } i = 2 \\ 0 & \text{otherwise} \end{cases}$$

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のQ@

### What about WLP and SLP?

► We computed: 
$$H^i(U, \mathbb{Q}) = \begin{cases} \mathbb{Q} & \text{if } i = 0, 4 \\ \mathbb{Q}^{\oplus 2} & \text{if } i = 2 \\ 0 & \text{otherwise} \end{cases}$$

• Then, for a general  $\zeta \in H^2_{\mathrm{Hdg}}(U)$ ,

 $\begin{array}{l} \cup \zeta : H^2_{\mathrm{Hdg}}(U) \to H^4_{\mathrm{Hdg}}(U) \text{ is surjective} \\ (\cup \zeta)^2 : H^2_{\mathrm{Hdg}}(U) \to H^6_{\mathrm{Hdg}}(U) = 0 \text{ is trivially surjective} \\ \cup \zeta : H^4_{\mathrm{Hdg}}(U) \to H^6_{\mathrm{Hdg}}(U) = 0 \text{ again, trivially surjective} \end{array}$ 

## What about WLP and SLP?

► We computed: 
$$H^{i}(U, \mathbb{Q}) = \begin{cases} \mathbb{Q} & \text{if } i = 0, 4 \\ \mathbb{Q}^{\oplus 2} & \text{if } i = 2 \\ 0 & \text{otherwise} \end{cases}$$

• Then, for a general  $\zeta \in H^2_{\mathrm{Hdg}}(U)$ ,

$$\begin{array}{l} \cup \zeta : H^2_{\mathrm{Hdg}}(U) \to H^4_{\mathrm{Hdg}}(U) \text{ is surjective} \\ (\cup \zeta)^2 : H^2_{\mathrm{Hdg}}(U) \to H^6_{\mathrm{Hdg}}(U) = 0 \text{ is trivially surjective} \\ \cup \zeta : H^4_{\mathrm{Hdg}}(U) \to H^6_{\mathrm{Hdg}}(U) = 0 \text{ again, trivially surjective} \end{array}$$

• Hence,  $H^*_{\text{Hdg}}(U)$  satisfies WLP and SLP.

More complicated than variation of weak/strong Lefschetz property, due to jumping phenomenon of Hodge rings.

 Harris conjecture: There are only finitely many special components.

• Let L be an irreducible component of  $NL_{d,1}$ . Then,

$$(d-3) \leq \operatorname{codim}(L, U_{d,1}) \leq \binom{d-1}{2}.$$

- If codim(L) is maximal, then L is called a general component. Otherwise, L is called special.
- Irreducible components of the Noether-Lefschetz locus NL<sub>d,1</sub> arise from flag Hilbert schemes.
- Expectation: Special components of NL<sub>d,1</sub> are characterized by low degree curves.
- Harris conjecture: There are only finitely many special components.
- ► Theorem (-): If NL<sub>d,1</sub> is equipped with the natural scheme structure (as Hodge loci), then there are infinitely many special components (of codimension 2d 6) for all d ≥ 6.

Question 1: Does the property of being weak / strong Hodge-Lefschetz specialize i.e., given a DVR R and a (smooth) family of projective varieties:

 $\pi: \mathcal{X} \to \operatorname{Spec}(R),$ 

if the generic fiber is weak / strong Hodge-Lefschetz, is the special fiber also weak / strong Hodge-Lefschetz?

Question 1: Does the property of being weak / strong Hodge-Lefschetz specialize i.e., given a DVR R and a (smooth) family of projective varieties:

 $\pi: \mathcal{X} \to \operatorname{Spec}(R),$ 

if the generic fiber is weak / strong Hodge-Lefschetz, is the special fiber also weak / strong Hodge-Lefschetz?

We expect this to happen because if the generic fiber lies in an irreducible component of the Noether-Lefschetz locus, then so does the special fiber.

Question 1: Does the property of being weak / strong Hodge-Lefschetz specialize i.e., given a DVR R and a (smooth) family of projective varieties:

 $\pi: \mathcal{X} \to \operatorname{Spec}(R),$ 

if the generic fiber is weak / strong Hodge-Lefschetz, is the special fiber also weak / strong Hodge-Lefschetz?

- We expect this to happen because if the generic fiber lies in an irreducible component of the Noether-Lefschetz locus, then so does the special fiber.
- Then, we use arguments similar to the specialization of the weak / strong Lefschetz property mentioned earlier.

Question 1: Does the property of being weak / strong Hodge-Lefschetz specialize i.e., given a DVR R and a (smooth) family of projective varieties:

 $\pi: \mathcal{X} \to \operatorname{Spec}(R),$ 

if the generic fiber is weak / strong Hodge-Lefschetz, is the special fiber also weak / strong Hodge-Lefschetz?

- We expect this to happen because if the generic fiber lies in an irreducible component of the Noether-Lefschetz locus, then so does the special fiber.
- Then, we use arguments similar to the specialization of the weak / strong Lefschetz property mentioned earlier.
- ► Question 2: Let Y be a smooth, projective variety and X ⊂ Y be a non-singular, very ample divisor in Y. If Y satisfies weak / strong Lefschetz property, then does X satisfy the same property? Conversely, if X satisfies weak / strong Lefschetz property, then does Y satisfy the same property?

- Denote by  $\zeta_X \in H^1(X, \mathbb{Q})$  the image of  $\zeta_Y$ .
- We have the following commutative diagram:

$$\begin{array}{c} H^{i}(Y,\mathbb{Q}) \xrightarrow{\bigcup \zeta_{Y}} H^{i+1}(Y,\mathbb{Q}) \\ \\ \downarrow & \bigcirc \\ \\ H^{i}(X,\mathbb{Q}) \xrightarrow{\bigcup \zeta_{X}} H^{i+1}(X,\mathbb{Q}) \end{array}$$

▶ If  $i \neq n - 1$ , then the two vertical arrows are isomorphism.

- Strategy: Take an element  $\zeta_Y \in H^1(Y, \mathbb{Q})$ .
- Denote by  $\zeta_X \in H^1(X, \mathbb{Q})$  the image of  $\zeta_Y$ .
- We have the following commutative diagram:

• If  $i \neq n - 1$ , then the two vertical arrows are isomorphism.

For such *i*, the ∪ζ<sub>Y</sub> is injective (resp. surjective) if and only if ∪ζ<sub>X</sub> is injective (resp. surjective).

- **Strategy:** Take an element  $\zeta_Y \in H^1(Y, \mathbb{Q})$ .
- Denote by  $\zeta_X \in H^1(X, \mathbb{Q})$  the image of  $\zeta_Y$ .
- We have the following commutative diagram:

• If  $i \neq n - 1$ , then the two vertical arrows are isomorphism.

For such *i*, the ∪ζ<sub>Y</sub> is injective (resp. surjective) if and only if ∪ζ<sub>X</sub> is injective (resp. surjective).

• Remaining to check for 
$$i = n - 1$$
.
